TITLE At the Brink; Preliminary Report on the Economic Status of the Profession, 1970-71.

INSTITUTION American Association of Univ. Professors, Washington, D.C.

PUB DATE Apr 71

NOTE 88p.; Presented at the 57th Annual Meeting of the American Association of University Professors, Philadelphia, Pa., April 16-17, 1971

EDRS PRICE EDRS Price MF-\$0.65 HC-\$3.29

DESCRIPTORS *College Faculty, *Faculty, Fringe Benefits, Income, *Salaries, *Surveys

IDENTIFIERS *American Association of University Professors

ABSTRACT

Part I of this report on the economic status of college and university professors discusses the experience of the year 1969-70 in terms of rate of increase in compensation which, taking real purchasing power into account, was only 2 percent; this part also presents statistical data and an analysis of salary increases by type of institution and type of control. Part II deals with the dimensions of the crisis facing the profession and the choices it poses. The third part discusses the nature of the AAUP survey and its rating scales. The ratings were revised in 1969, and some criticism of these revised ratings is included. The bulk of the report consists of statistical tables on salaries and salary increases in various types of institutions. (AF)

PRESENTED AT THE FIFTY-SEVENTH ANNUAL MEETING
PHILADELPHIA, PENNSYLVANIA, APRIL 16-17, 1971

AT THE BRINK

PRELIMINARY REPORT ON THE ECONOMIC STATUS OF THE PROFESSION, 1970-71¹

This year's report on the economic status of the profession, in addition to introducing a much expanded set of data, will discuss three issues; first the experience of the academic year just past, second the dimensions of the crisis facing the profession and the choices it poses, and third the nature of the AAUP survey and its rating scales. Inclusion of the first two requires neither comment nor defense. A detailed review of Committee Z's policies and procedures is required not only because the bases of recent changes have been widely criticized as well as frequently misunderstood, but because they are now to be subject to yet further modifications.

Part I: Standstill and Erosion

Rate of Increase in Compensations

A year ago our report began "Taking into account the rise in price level, the change in faculty compensations was scandalously small.... *In terms of real purchasing power, compensation levels grew less than 2 percent.*" (Emphasis in original.)

¹*Chairman's Footnote:* The Committee Z report is the product of so many hands as to make comprehensive acknowledgement impossible, but I do hereby express my thanks. While I lack Professor Baumol's gift of gracious acknowledgement, I am no less appreciative than he of all who contribute to the annual survey and its processing, for it is they, not I, who create this report. Only one person is indispensable, and she is listed as a co-author of this report. The other members of Committee Z, who contribute so willingly of their time and their intellects to the rewarding, but unrewarded, service of the Association, are parties to everything about the report except its drafting. Professors Ramona First and Albert Imlah completed terms of service with the Committee this year, and Professors Robert Dorfman, Jean E. Draper, and Robert J. Wolfson began new ones. Professors Robert W. Friedrichs and Peggy Heim continued in service.

In this, my first report, I have the pleasure of acknowledging the tremendous debt we all owe my distinguished predecessor, Professor William J. Baumol of Princeton University. His nine years as Chairman were ones in which the Committee and the profession flourished. The rise in real academic compensations during his tenure was large, and was significantly influenced by his efforts. I hope, however, that I will not be judged by that standard of success, for reasons that will be obvious soon, if indeed they are not already. My comparative disadvantages are great enough as it is. P.O.S.

The news this year, in brief, is worse! The Consumer Price Index (CPI) rose by nearly 6 percent over the relevant academic year, while average compensations rose approximately 6.2 percent. The increase in *real* terms thus was barely noticeable; this was, on average, a year of standstill. But standstill on average means that many of the members of our profession have suffered decreases in their real income.

This continuation in the downward trend of progress is illustrated dramatically in Figure I, which shows the change in average compensations (salaries plus fringe benefits) for each year of the decade. In each case the height of the bar represents the average percentage increase in compensations in money terms. But the white portion represents the increase in the Consumer Price Index. Thus, only the black portions of the bars represent increases in purchasing power. In every year but this, a significant increase was achieved. The downward trend in the increase that began in 1967 continues, and threatens to turn into net decreases unless the course of inflation is reversed or unless compensations show an accelerated increase. Neither change seems very likely in the year ahead. Thus, overall, the prospect is severe. The inflationary erosion anticipated in each of the last two years' Committee Z reports is now very much a reality.

In order to view the data in a longer perspective, and also in yet a different way, it is necessary to shift from total compensations to average salaries. Figure II shows historical salary data back to 1949. For the first time in the history of our data, the overall average increase in salary levels was *less* than the increase in the cost of living. Erosion in salaries is a current reality.

Figure III looks at this phenomenon in a slightly different way, by showing the percentage of institutions of higher education that failed to provide average salary increases as large as the increase in the CPI. The proportion has grown alarmingly. The widening black wedge tells vividly the story of erosion of academic living standards. (Only the high cost of color printing keeps us from showing this in red.) As we shall see in a moment, the burden of this erosion has not fallen evenly on individuals and institutions, and for some the cut in real living standards has been large.

If current efforts to curb inflation prove to be ineffective, there is every reason to fear that real compensations in higher education will be eroded even more drastically. The intensifying financial crisis of institutions of higher education, the cutback in federal spending, and the collapse of the academic market for those seeking faculty positions, all mean that it will be difficult to secure the increases in remuneration necessary to offset the effects of rapid inflation. This makes it even more crucial to impress on administrators, boards, legislatures, and Congress the magnitude of the problem and the unwillingness of faculties to be the main source of subsidy to higher education through reduced rates of growth in compensation.

If the preceding paragraph has a familiar ring, be not surprised. It is taken verbatim from last year's report. Recognizing a problem and solving it are unfortunately not equivalent.

Analysis by Type of Institution and Type of Control

More detailed examination of this year's data can be done by studying either salary or compensation figures, as shown in Tables 1A and 1B, respectively, by type of institution, type of control, and academic rank. We will confine our textual remarks to salaries, but (as the tables show) the trends are not markedly different. Remembering that 6 percent is the national average increase in the CPI, it can be seen that for many groups the average salary increases fell below that necessary to prevent erosion of purchasing power. Among public institutions, none but the two-year colleges held their own, and those did so only at the junior ranks. Particularly severely hit were the public institutions in Category IIA -- emerging universities. Among private independent colleges (IIB), average salary increases were below the 6 percent standard at every rank. Church-related institutions did somewhat better than the average. Even for those categories that exceeded the average, few exceeded it by very much. Last year's report regarded an increase in real terms of less than 2 percent as "scandalously small." Yet only six of the eighty salary increases reported in Table 1A exceed 8 percent; i.e., better the increase in the CPI by 2 percent.

These data show unmistakably the erosion on the average in real salary levels. Their detailed interpretation requires several caveats.

First, not all institutions started from the same base, and the degree of scandal involved is a function of both levels and rates of change in salary and compensation levels. During the year just past, for example, Ivy League institutions suffered a greater erosion in their real incomes than the Big Ten Universities (average salaries increased by 4.6 percent and 5.6 percent respectively) but they ended the year as they had begun it with higher average salary levels. Thus, in evaluating the impact on living standards of faculty at any institution, attention must be paid to *level* as well as to *change* in compensation.

Second, the cost of living is not the same in different areas and the national average poorly represents areas which depart from it. For example, during this year the appropriate index (annual costs, higher living standard) for the New York and Boston metropolitan areas rose by more than 9 percent -- and thus for institutions in those areas, achieving even an 8 percent average increase would still constitute erosion of average salaries. Table 2 presents what we consider the most appropriate index of cost of living for faculty families for both 1969 and 1970. The figure for 1970 is helpful in interpreting salary levels; the change between 1969 and 1970 shows whether the area in question is experiencing inflation at more or less than the national average.

Third, the data on average salary by rank underestimate the increases in salaries of *individuals* within those ranks. Thus (to use a famous example),

¹ Preliminary data released by U.S. Department of Labor, December, 1970.

² The total represents the weighted average costs of renter and homeowner families.

³ Includes places with populations of 50,000 or more. For a detailed description, see the 1967 edition of "Standard Metropolitan Statistical Area," prepared by the Bureau of the Budget.

if an individual at the top of the associate professor rank receives both a salary increase and a promotion (to the lower end of the salary range of full professors), the average salary in *each* rank will decline as a result. Characteristically, persons enter ranks near the bottom of the salary scale and exit near the top, whether due to retirement, promotion, or resignation. Thus, on the average, salaries of individuals rise more rapidly than average salaries by ranks. Table 3 shows data that reflect average increases in salary *for individuals* on staff both years. This table shows that individual salary erosion is less pronounced. However, gains in real income appropriate to maturing and moving through the ranks normally must be expected to exceed markedly the increase in the cost of living. The average increase for all faculty reported is only 7.8 percent, surely not greatly above the 6 percent increase in cost of living.

It is clear from all of the above data that 1970 was a bad year for the academic profession. Whether it ushers in a disastrous decade remains to be seen. It is a possibility that cannot be ignored.

Part II: Crisis in Higher Education

That there is a "Crisis in Higher Education" can hardly come as a surprise to anyone who reads this report -- student, faculty member, administrator, trustee, legislator, or literate observer of educational institutions. Reports of the financial squeeze affecting higher education are almost too numerous to count, and there are regular headlines citing the increasing reluctance or inability of public or private funding sources to provide sufficient dollars to construct urgently needed facilities, to provide essential supporting services, to furnish the necessary financial aid to enable students to stay in school, or to pay the faculty and staff amounts required to maintain both high quality and high morale.

In its 1968 report (*AAUP Bulletin*, Summer, 1968), this Committee reported on the emerging plight of the private institutions; in 1970 (*AAUP Bulletin*, Summer, 1970), we addressed the causes of the worsening problems of the public institutions. We shall not repeat those discussions here, although they remain distressingly relevant today.

More recently, Earl F. Cheit, in a report for the Carnegie Commission on Higher Education entitled *The New Depression in Higher Education*, estimated that approximately two-thirds of the colleges and universities in the United States are in financial difficulty or headed for financial trouble. This shortage of funding has not led simply to some uncomfortable "belt-tightening"; it has forced a number of schools to close down completely, and has pushed many more to the brink of collapse. In a recent report (*The Red and the Black*, by William W. Jellema), the Association of American Colleges stated that 47 percent of the 554 private institutions replying to its survey were operating at a deficit.

The plight of public higher education is no less serious though less dramatic. State legislatures, faced with a restricted tax base and rapidly

growing demands upon state funds, do not declare public institutions bankrupt, but they are frequently unwilling and/or unable to meet the essential budget requests of colleges and universities faced with expanding enrollment, increased costs due to inflation, and demands for new programs.

The sudden intensity of the financial crisis of educational institutions is the product of both long-run trends and shorter-run factors. It is clear that the continuing war expenditures and the troublesome inflation account for some of the shortage of Federal funds; it is clear that the recession affects both private giving and state and local finances. But the differing trends in the costs of providing educational services, and the revenues available to meet those costs, are likely to persist far beyond the war in Vietnam or the recession at home.

The financial problems of higher education have repercussions for all members of the community. Parents and students face rapidly increasing tuition and fees, which serve to limit the educational opportunities of able but needy students at the very time when scholarship and loan programs are shrinking; budget officers strive to balance unbalanceable budgets; and legislators struggle with more meritorious demands than their tax revenues allow them to serve.

Faculties bear with particular incidence the force of these general pressures. Obviously the impact on faculty members is most severe when an institution closes its doors or is forced to cut the size of its faculty. (This is occurring in an accelerating way; the greatest single cause of requests by faculty members for assistance by this Association during the last year has been dismissal or nonrenewal on grounds of financial exigency.) But those who remain on faculties also feel the pinch. The lack of funds often translates into heavy pressure to take reductions in instructional budgets and to forego or greatly limit salary increases. Given these pressures, and given a continuing high rate of inflation, many salaries tend to increase at a rate less than the cost of living, thus leading to actual decreases in real income. As we saw in Figure III, this is currently true of the average faculty member in a majority of our reporting institutions.

Faculty compensation today is particularly vulnerable because the market forces of demand and supply that for a decade worked to bolster demands for increases in faculty compensation have turned the other way. The decade of relative boom in academic compensations that began in 1959 is depicted in Figures IV and V. Figure IV shows the enormous growth in student enrollments and shows also the increase in demand for faculty that accompanied it. At the same time that demand was expanding rapidly, supply -- the output of our graduate schools -- was increasing only slowly and a sellers' market emerged. This Figure also shows that faculty hirings did not keep pace with student growth; the rising student-faculty ratio had several consequences. In one sense it made obtaining faculty compensation increases easier, as faculty costs per student declined; in another sense it led to increasing class sizes and to use of inexperienced teachers; in so doing it has surely contributed to the undergraduate student feelings of resentment and neglect in many institutions.

In any event, these forces led to rapidly increasing levels of money compensation, as Figure V shows. The widening gap between average salaries and the CPI reflects the average increase in purchasing power over the period. Comparison of the level of faculty salaries (solid line) with national average increases in per capita personal income (dashed line) shows, however, that the academic profession over most of this time was not making great *relative* gains in income. Income per capita rose as rapidly as academic salaries from 1961 on. But the boom in higher education made it possible for faculties to maintain their relative status and increase their real incomes at about the national average rate.

A close examination of these two Figures shows not only the boom of the sixties, but also the beginning of the long-predicted reversal. The rate of increase of student enrollments has begun to slow, and the slowdown is predicted to continue at least through the seventies. It has already led to a flattening out of the demand for new faculty, as hard-pressed administrators have not utilized the opportunity to roll back class sizes and improve student-faculty ratios. Indeed that ratio continues to climb, thus reflecting a magnified retardation in demand for faculty. This fall in demand has made staff reductions and hiring freezes a tenable policy for administrators in financially pressed institutions. The reduced demand for faculty, combined with a belated rising supply of new candidates for faculty positions, has led to a shift from a sellers' to a buyers' market in academic personnel, as Allan M. Cartter and others had predicted it would. Preliminary reports suggest that the 1971 academic market exhibits a very substantial increase in the excess of supply over demand for faculty positions, although the final data are not in yet.

Given the general financial plight of educational institutions, and given the loss of market imperatives for increasing salaries, faculty compensation was sure to come under pressure. Other factors reinforce these tendencies. One of these is that other demands on scarce institutional budgets may seem, to students, to administrators, and to outsiders, to present more compelling claims. For one example, the demands for educational opportunities for minority students are increasingly regarded as urgent claims on educational resources, but they are exceedingly expensive to meet. For another, student requests for financial assistance are rising rapidly in the face of escalating tuitions, fees, and living costs, and decreased off-campus employment opportunities. Importantly also there are groups in the academic community who are more militant and less well paid than faculty -- from teaching assistants to custodial employees -- who are pressing salary claims that seem to the general public at least as urgent as further faculty compensation. As we are all aware, the general public never has understood what faculty members do with their time outside of classroom hours. (A Wisconsin farmer once wrote us asking for an explanation of "why professors get paid so much, but teach so little." The editor of the *Michigan Daily* editorialized this Spring that the University of Michigan budget crisis was really due to faculty sloth.) Recent studies in California and Wisconsin establish what we all know: the typical faculty work week is about 55 hours. Our past failures in educating the public to these facts do not help us now.

As we saw in Part I, we are no longer widening the gap over the cost of living shown in Figure V. Without a reversal of present trends, the gap will soon begin to close. The relatively parallel lines in Figure V for per capita personal income and average salaries suggest that we have just maintained the relative status of the profession. The most recent data show that we are beginning to lose ground compared to the average American. Are these merely transitory phenomena? The continuing buyers' market and the public mood provide little basis for optimism that faculty compensation levels will rise enough to reverse these discouraging trends.

Choices for the Future

It is clear, then, that a troublesome decade is upon us. It poses problems and choices for university professors as well as for other groups. There is no magic wand or hidden button which will quickly reverse the trend. As one correspondent wrote to us:

"The timing is wrong.... Today's mood is anti-inflation, anti-education, anti-spending, anti-union, anti-campus, and anti-faculty. This mood will translate, regretfully, to lower salary increases for faculty at both private and public institutions."

At the same time that the nation is making its choices as to how many of society's resources shall be devoted to higher education, the entire profession inevitably faces a host of hard choices with respect to how to respond to severely limited funds. However the broader societal questions are answered -- and we may hope that federal assistance to higher education increases -- the higher education community cannot avoid its own tough decisions. Such decisions, if they are not made explicitly, will be made implicitly; if they are not made by us, they will be made for us.

The choices we face are of two different kinds: first, the sorts of trade-offs the profession will choose in distributing limited resources, and second, the modes of response to the pressures of financial difficulty.

Alternative Allocations of Funds for Faculty Compensations

A first choice is between salary and teaching loads. One view of the academic "product" is student credit hours. If this is accepted, then the individuals producing that product can increase their earnings by reducing their number. Either increasing the number of courses taught or increasing average enrollments per course will allow fewer faculty to provide the same number of student credit hours. Faculties can, in effect, cannibalize faculty positions and increase their own compensation without increasing budget costs per student. To some, this has seemed a form of increasing "productivity" that is attractively simple to achieve.

In this connection let us note why we continue to resist the notion of defining productivity of academic employment by such measures as students

or credit hours taught per faculty member. Either increasing class size or increasing courses taught per faculty member would reflect an increase in productivity in such a definition. But each would surely reflect a decline in the quality of education offered, other things being equal. As Professor Baumol has frequently pointed out, the real (but hidden) increase in productivity of college professors is the increased productivity of the students they train, not the visible increase in numbers of students met.

There is some danger that this choice will be made moot for significant segments of higher education, as legislatures or donors choose the alternative of higher teaching loads. Some states have legislated increased teaching loads. The governor of a large state has recently announced that his budget for higher education presupposed a 3 percent increase in faculty productivity (by which he means teaching load).

A trade-off closely related to the salary-teaching load issue is that between teaching and research. Because the short-run economic return (to those concerned with meeting budgets) of the research activities of faculty is indirect, while the payoff from more teaching is direct, there is political and administrative pressure to put more time and energy into teaching and less into research. Yielding to that pressure is likely (at least in the short run) to increase the economic return to the faculty. The longer run implications would be to change the character of our educational institutions in ways that are difficult to quantify and to estimate, but we view a significant reduction of research activity as a step with ominous portent for education and society.

The choice between teaching and research is closely tied to the trade-off between undergraduate and graduate instruction. It is a cliché that an undergraduate student credit hour costs less than a graduate student credit hour. In the long run, shifting resources to undergraduate instruction can economize on the instructional budget, thus possibly freeing funds for faculty compensation. The short-run effects on cost of instruction are less clear, for a great deal of inexpensive instruction is done by graduate students. Thus any sharp reduction in graduate student enrollments and use of teaching assistants will increase educational costs per student and thus exacerbate the pressure on the budget for faculty pay.

In days when the total amount available for salary increases is not significantly greater than the cost of living, and indeed when it may be less, an important choice facing the profession concerns the distribution of a given pool of money available for salary increases among a given faculty. The choice is frequently described as between "across-the-board" raises and selective raises, or (more simplistically) "across-the-board" vs. "merit." One aspect of that choice concerns the makeup of an institution's faculty. Devoting all or most of the available money for compensation increases on an across-the-board basis provides no funds to retain those whose market position remains strong, and it may also serve to remove market incentives for excellence. On the other hand, erosion of real income can cause real hardship, and if the distribution of selective raises is

made by an arbitrary or autocratic administration, it may be that conformity will prove to be the principal ingredient of "merit." Pressures for conformity can stifle freedom, diversity, and excellence.

Confronting these choices, and many others, not all institutions will or should make the same choices. Institutions differ in their nature, in their aspirations, and in the students and faculty who inhabit them.

Modes of Response

The choices described above (and many others) will be made, somewhere and somehow, for every institution. That this is so presents faculties with the choice of their mode of response to the pressures of these difficult times. Of the various forms of response which might be discussed, three embody the basic alternatives.

A first mode of response is passive. In it, a faculty does nothing special and tends to acquiesce in the decisions made by other segments of the institution or by outside agencies, hoping that the various pressures and counterpressures somehow will not seriously or permanently erode the existing role of faculty in the educational process. In view of the increasing pressure from students to play a role, in view of the continuing increase in outside surveillance of budgetary allocations, it seems probable that this course will lead to a marked reduction of the role of the faculty in the government of the institution. Since we have always regarded our role as truly central to university governance, this passive role, although the one of least resistance, clearly implies major changes in the structure of our institutions.

A second mode involves the assertion (or reassertion) of the principle of shared authority, based on the "inescapable interdependence among governing board, administration, faculty, students and others."² This principle holds that the faculty is an integral and essential part of the government of the institution, that it must be effectively involved in *all* of the decision-making processes, and, in particular, that the faculty bears primary responsibility for faculty status and related matters. As financial stresses increase, this mode of response calls for expanded and intensive exercise by the faculty of this and other responsibilities, which in turn requires close attention to the organization and operation of agencies of faculty government.

A third mode of response may be characterized as the adversary mode. In it the faculty operates not as a partner but as a power. As a separate agency it formulates, articulates, and pursues its own interests. Recent passage of state public employment relations acts, coupled with acceptance of jurisdiction over private colleges and universities by the National Labor Relations Board, means that this adversary mode may follow the form of

²1966 *Statement on Government of Colleges and Universities*, jointly formulated by the American Association of University Professors, the American Council on Education, and the Association of Governing Boards of Universities and Colleges.

trade unionism and utilize exclusive representation and collective bargaining techniques. Within this mode there is room for great variety of response, both in terms of the nature of issues bargained about, the nature of group representation, and the degree of militancy pursued. Faculties at a significant number of educational institutions have already moved into this adversary stance, and many more are discussing it. It merits careful discussion, for it surely changes greatly the traditional posture of faculties.

Once again the choice among modes of response involves hard but vital choices. It is not at all clear that every institution should choose the same way. But it is very clear that the choices should not be made by default. The future of the profession and the society demand that we give them our best, informed, attention. Committee Z believes it can contribute to these decisions in a major way by collection, analysis, and publication of data that will aid in understanding of the issues. In addition to its annual survey, which is discussed in detail in the next section of this report, we are now sponsoring an intensive three-year study of the economics of the academic labor market, and the forces that shape it. If we have learned nothing else in the past decade, we should have recognized that our status is intimately bound to the economic and market forces that surround us and the institutions in which we work.

Part III: The Survey and the Scales: Past, Present, and Future

The AAUP survey utilizes and depends upon the voluntary cooperation of reporting institutions. This year, 1367 submitted returns. It is used by faculty groups, administrators, and many others. It enjoys both this extraordinary cooperation and its usefulness by virtue of its reputation for integrity. Over the years, Committee Z on the Economic Status of the Profession has met regularly with representatives of the Association of American Colleges to assure that this faculty-run enterprise understands and appreciates the interests and needs of institutions as well as of faculties. In the period of financial crisis that we have described above, faculty and institutional administrators are increasingly viewing themselves in adversary stances, and the spreading practice of collective bargaining will reinforce this view. In this climate, the changes in our collection and reporting procedures have been subject to what can most charitably be described as searching review by numbers of critics, faculty members and administrators alike. We feel it is imperative to discuss at some length the nature and function of our scales, and the reasons for past and proposed changes therein. If we cannot command the continued respect of both faculty and administrators, we cannot continue to function in this area.

The First Decade

The survey was designed and introduced in 1958 at the start of what proved to be a decade of extraordinary growth of higher education and a period

of improvement in the economic status of the profession. This improvement, it should be recalled, was long overdue, as the profession had suffered two decades of erosion of its relative status. The intent of Committee Z in introducing the scales was to assist in this improvement by providing faculty and administrators with the information and guidelines they needed in budget-making, and in persuading trustees, legislators, and others of what could be achieved by given increases in money for increasing faculty compensation. It was the intention of the Committee to provide targets for improvement year by year. The scales were designed to make it difficult, but not too difficult, to maintain a grade or to achieve a better one. The climate of growth in education, and competition for new faculty, made the quest for rising compensation one in which both faculties and academic administrations joined. Over the years, more and more institutions succeeded in achieving high grades. One result of this was that our scales gradually lost much of their ability to discriminate between compensation levels at different institutions. This was illustrated in the *AAUP Bulletin*, Winter, 1969, Table 1, (p. 479), which showed, among other things:

"[I]n 1968-69, 80 percent of the professors, 98 percent of the associate professors, and 100 percent of the assistant professors teaching in universities were at institutions where the average compensation for their particular rank graded B or better."

At the same time, as Figure V clearly shows, we were not, as a profession, gaining relative to the standard of per capita personal income. Thus the notion of general "honors" grades was essentially misleading.

The 1970 Revisions

The 1970 revisions -- adopted in 1969 -- and described in the article just referred to, included both an increase in the amount of information available and a change in the basis of rating. As we have seen in the previous section, the general academic and budgetary picture had changed sharply. The changing circumstances and the lack of discrimination in our scales necessitated a review of our procedures. We decided that on the brink of crisis there was a preeminent need for every institution and its faculty to take a realistic view of where it stood relative to other institutions, and to decide what strategy it wished to pursue in both the near and more distant future. Because institutions differ in relative position, in aspirations, in the severity, imminence, and nature of their financial difficulties, and in the willingness of faculty and administration to work together toward a viable policy for the seventies, there can be no single standard of salary increase that is appropriate to all. There is, however, a uniform need for full, accurate, and relevant information on which to base budgetary decisions. We sought to provide that information, and thus to illuminate, not conceal, the real dimensions of the problem.

Committee Z felt that it had an inescapable responsibility to improve and expand the data available to faculty and to institutions. The extent to which the 1970 revisions have led to new information may most readily be

seen by comparing the data in Appendix I for this year and last year. Newly available for each reporting institution are average compensation by rank; fringe benefits as a percent of average salary by rank; actual percentage increases in salary for individuals employed in both 1969-70 and 1970-71, by rank; announced minimum salaries by rank; and the quartiles of the salary distribution for the institution as a whole.

Using these data, a wealth of information is available to any faculty member or any institution relative to *any* group of institutions with which it chooses to make comparisons. (We will discuss below *additional* comparisons that will be made available upon request.)

A major revision in 1970 was a change in the rating scheme. Since this feature of the changes has caused widespread comment, concern, and -- bluntly -- complaint, it is well to understand precisely what was changed. The revision can be best understood if it is thought of as having three aspects: (1) the replacement of subjectively determined scales for grading by rating scales grounded upon actual data from past surveys about achieved levels of compensation; (2) the rating of institutions of different types by different scales; (3) the use of growth in per capita personal income as the basis for projecting scales two years into the future. Each merits comment.

(1) The first and most important aspect of the change was to replace *grading*, by reference to arbitrary and preset scales, by *rating* against scales that were projections of *actual decile distributions* of compensation levels of reporting institutions. The new ratings, in contrast to the old grades, were based upon and controlled by actual data, and thus ultimately by market realities. Whether one views this substitution of a descriptive for a normative base of rating as commendable or contemptible, it must be understood. We did not substitute one normative rating for another, but replaced a normative by a descriptive rating. The substitution of "rating" for "grading" is more than a semantic difference.

(2) In order for descriptions based upon decile distributions of institutional averages to have relevance, it is necessary that the groups of institutions classified be relatively homogeneous. Yale University, Wofford College, and the Montgomery County Community College are different kinds of academic institutions with different kinds of faculty requirements, and they compete for staff in different labor markets. This is not a normative judgment, it is a simple fact. We sought, as a first approximation to more homogeneous groupings, to divide institutions into three categories: Universities, Four-Year Colleges, and Two-Year Colleges.

(3) Projection of scales is undertaken in order to provide interested parties with data in a form relevant to current budgetary decisions and negotiations. In April of 1971, the required information concerns 1972-73, and thus must be based on factual data for 1970-71. Lacking perfect foresight, and lacking as well any extraordinary competence in economic forecasting, Committee Z sought a basis for projection that would be both understandable, and not too inaccurate. The index used was the change in per capita personal income in the United States as reported in the most

recent year. A glance at Figure V suggests it has had some descriptive accuracy for many years. This measure reflects the increase in money income of the average U. S. resident, and roughly captures changes in the average cost of living as well as average productivity increases. Projecting scales on this basis says that, if the economy continues to change as in the recent past, and if the academic profession as a whole does this well, it will neither have gained nor lost ground in the two-year period relative to the national average. Shortfalls from this standard (if the economy has not changed its rate of growth) measure roughly the erosion of the position of academics compared to two years previous. These projections say nothing about how adequate or inadequate that *status quo ante* was; they say nothing about the ability of institutions to pay. But this measure is related to the economy as a whole; it is interpretable; and (historically) it is not too far from what the actual market is likely to produce.

The ratings of individual institutions based upon these projected scales appear in Appendix I of this report. The levels of compensation used for ratings appear in Table 4. For example, the data for Dickinson College in Pennsylvania show that the average compensation level of its 30 full professors (\$19,600) places it above the "3" level for Category II institutions (\$18,840) but below the "2" level (\$20,210). It thus has a "3" rating for full professors in Category II.

Criticisms of the Revised Ratings

We have received the attention and suggestions of many individuals, chapters, administrators, and associations with respect to these revisions in our procedure. While some criticisms reflect misunderstandings of our procedures and our purposes, and others reflect disagreement with our objectives, still others represent valid identification of deficiencies in our procedure. It is convenient to discuss major categories of complaint under headings that paraphrase more detailed complaints.

1. *"Grades have been arbitrarily lowered by this shift."*

Consider the following complaint by an administrator:

"I was shocked to see the new scale in contrast with the previous ones, 1969-70. Those of us who have worked hard to raise faculty compensation over the years have been dealt a real blow. In our case, a small, independent two-year institution, we have gradually increased not only our actual dollars, but *more importantly*, our place in the AAUP compensation scale. We certainly do not pay munificent salaries, but within our limited, need I say very limited resources, we have made real progress *according to AAUP standards*. Now I see that even with an approximate 10 % raise next year, we will be off the bottom of the new scale." (Emphasis supplied.)

The college in question had an overall grade of D in 1969-70 (but A at the instructor level), but rated 9 or 10 in each rank in 1970-71. Such

Note: Category I includes (1) Institutions which offer the doctorate degree, and which conferred in the most recent three years an annual average of fifteen or more earned doctorates covering a minimum of three nonrelated disciplines. Category II includes institutions granting the baccalaureate degree or higher but not included in Category I. Category III includes two-year institutions.

* Compensation figures less than those in the 9 column of the appropriate scale have been rated as 10.

changes occur with some frequency: one large university went from grades of C, B, B, A to ratings of 9, 10, 8, 9.

This kind of apparent change in rating reflects the need for the revision, not its shame. After a decade, the arbitrary grades had become comforting but not very meaningful. Instructors' compensations, for example, rose much faster than the AAUP scales, and thus everyone was grading well. The market demand for instructors had outstripped Committee Z's official aspirations for instructors' compensations. In what sense should we regard the scales as right, and the market as wrong? The facts show that some institutions -- including the two cited above -- had levels of compensation that were relatively very low, notwithstanding A grades. However regrettable this fact is, it is relevant, and if our earlier procedure obscured that fact, it was deficient by virtue of that concealment.

The new ratings, to repeat, are not grades for effort, nor are they normative evaluations: they are (roughly) descriptive of relative levels of compensation. Each institution must decide whether its level of compensation brings it pride, or shame, and what fraction of its resources it can or should devote to changing them. While under the old grading scheme everyone could be B or better, not everyone can be in the top 10 or 20 or 50 or 90 percent. If the letter grades had some independent informational content, they might have been worth retaining. But we became convinced that they had progressively lost such content.

2. *"Relative performance has been arbitrarily shifted in the new ratings."*

The following comment by a faculty member correspondent reflects this concern:

"Under the old letter-grading system our Professors received a grade of B and our Associate and Assistant Professors each received a grade of A. Under the new system our Professors are seemingly much better off and the two lower ranks have sunk into the [low] decile ratings."

For this large university, letter grades of B, A, A, were replaced by ratings of 5, 7, 6.

A shift like that above reflects the progressive inadequacy of our previous scales and the need for change. AAUP scales over recent years were explicitly designed to encourage a widening of the gap between the salaries in senior and junior ranks, a gap that had been compressed by market forces, but market pressures did not cooperate. The realities of labor market competition for new instructors and assistant professors in the decade of sharply rising demand led many institutions to raise salaries at the entering levels more rapidly than those of full professors. Because of this, many institutions effortlessly overtook the AAUP scales at the junior levels while fewer did so with the more rapidly rising senior level scales. The cumulative effect proved dramatic. For example, in 1963-64, only 32

percent of universities rated A or better at the assistant professor level; by 1968-69, 91 percent were so rated. The comparable percentages for full professor rose only from 16 to 26. Clearly the letter grades showed different things for different ranks.

3. *"The rate of increase utilized in projecting the scales is unreasonable."*

This same comment has meant, to different critics, three different things:

- (a) *"The rate utilized is not descriptively accurate."*

Obviously no projection is absolutely accurate, but the differences between the *projected* 1970-71 decile distributions (Table 4) and the *actual* 1970-71 distributions by institutions (Table 5) were not large, as Table 6 shows for Categories I -- III. (The doubling of sample size in Category III results in less stable data, but the same average trend.) The actual distribution did fall short of the projected distribution, partly due to a falloff in the economy as a whole which did not maintain the rate of growth in per capita personal income used in the projection, partly due to some erosion of the position of faculty relative to the average income receiver, and partly due to a 20 percent increase in our sample. (The newly reporting institutions tended to have slightly lower compensation levels than did institutions reporting both years.) As the table shows, these discrepancies do not support the claim of unreasonable projection.

A real, and remediable, consequence of the inaccuracy introduced by any discrepancies between forecast scales and actual data is that this year's numerical ratings do not reflect deciles of the actual distribution. Table 7 shows the extent to which the frequency distribution (in numbers and percent) of institutions with each rating varies from a straight decile distribution. For reasons noted above, there tends to be less than 10 percent of the reporting institutions in the top deciles, and more than 10 percent in the lower ones. Had we rated on the basis of the actual decile distribution, the ratings of some individual institutions would have been improved. We now think we should have rated according to actual distributions, not projected ones; in the future we will.

- (b) *"The rate used is not high enough because faculties' status should improve."* We have heard this criticism from several faculty members and AAUP chapters, who believe any projection ought to embody an "appropriate" rate of increase. While as faculty members we would like to have compensations rise very rapidly, this does not justify our projecting at the rate of 20 percent or 100 percent per year. We have no license to determine a "just" rate: indeed, there is no single ideal rate of increase, in part because different institutions have different problems, different aspirations, and different positions from which they start. Rather than rely on a subjective rate, we chose one which was based on a measure of income growth in the economy. Whatever its deficiencies, it is unambiguously interpretable.

¹ Projected by using 1968-69 actual decile distribution of average compensations increased by 8.0 percent compounded twice.

Interpretation of data: In Category I, for the rank of professor, the 1970-71 actual average compensation (80th percentile) was 0.6 percent lower than the average compensation (rating 2) in the projected 1970-71 scales.

¹ Based upon AAUP 1970-71 Compensation Scales.

² Average compensations less than those in the 9 column of the appropriate scale have been rated as 10.

³ Percentages may not total 100 because of rounding.

(c) *"The rate used is too high given the financial plight of the nation's colleges and universities."* This complaint is directly opposed to the one above. It comes from hard-pressed college administrators who would like the AAUP to endorse very modest increases in compensations to ease the financial plight of the colleges in which the faculty have a stake. We have elsewhere noted that that plight is real, and that college and university faculties must define their role in discussing these problems. We have neither the wisdom nor the authority to determine on a national basis what is an appropriate response, and we clearly must reject the implicit notion that faculty pay is in any sense a residual claim on tight educational resources.

The disparate reaction to our basis of projection is a source of modest comfort. If displeasing everyone is a measure of any virtue, we believe our virtue is assured.

4. *"Deciles are peculiarly inadequate bases for ratings."*

Critiques under this heading are of two kinds, both of which we find persuasive. The first is that for those institutions that strive to be at the top, the standard of the top 10 percent is not demanding enough, and we should do nothing to discourage those aspirations. We shall from now on include data adequate to identify the top 5 percent in any category.

The second objection is both statistical and substantive. It is that the deciles give too much emphasis to small and arbitrary differences. In this view, the difference, for example, between 9 or 10 (or 5 and 6) may be both uninteresting and statistically capricious, particularly in categories with smaller sample size. In this view, a smaller number of ratings would be preferable. On purely statistical grounds this view seems to be meritorious.

5. *"The categories of institutions defined prove unsatisfactory."*

Again this general view reflects a variety of different complaints:

(a) *"Faculty are faculty, wherever they teach."* This view, which we believe to be correct in human terms, but incorrect in terms of job descriptions, required training, and alternative employment opportunities, has led some to urge the use of a single category of institutions. With these critics we must simply agree to disagree.

(b) *"The AAUP is an organization of individuals, not institutions."* Many feel that although data are reported by institutions, the weight attached to any institution should vary with the size of its faculty. In Table 8 we provide a tabulation of decile distributions weighted by number of faculty members, which permits any interested reader to develop alternative ratings. There are arguments that can be made for use of either the distribution based on number of faculty or the one based on number of institutions. All in all, we have decided to use the latter, but will continue to provide both sets of distributions.

Table 8

NOTE: Category I - includes institutions which offer the doctorate degree, and which conferred in the most recent three years an annual average of fifteen or more earned doctorates covering a minimum of three nonrelated disciplines.

Category IIA - includes institutions awarding degrees above the baccalaureate but not included in Category I.

Category IIB - includes institutions awarding only the baccalaureate or equivalent degree.

Category III - includes two-year institutions.

Category IV - includes institutions without academic ranks.

*Sample too small to be meaningful

(c) *"The categories are not sufficiently homogeneous."* An example of concerns that many have raised is the lumping of the small, independent, private, four-year colleges with large, public, four-year institutions. We believe there *are* unfortunate heterogeneities in our categories, and we are seeking ways to improve the groupings. Subject to the requirements of sample size, we are prepared to revise our groupings in ways that prove fruitful. The data so far collected and analyzed have persuaded us that at least a subdivision of Category II is desirable.

6. *"The data published are misleading because of neglect of cost-of-living differences."*

We are of course aware of the significant differences in the cost of living among areas, but we lack the information to make a sophisticated deflation of the data for any institution. The published data are limited, at best, and suffer the usual deficiencies of all index numbers. We shall continue to publish what we consider the best available indices of relative living costs (see Table 2), and we urge all users to consider these data, as well as the absolute levels of compensation reported, and other relevant factors, in determining the relative affluence or poverty of faculty at different institutions. But such comparisons are not mechanically made. For example, the reported cost of living in the New York metropolitan area is approximately 20 percent higher than in Detroit. But variations in effective living costs for locations *within* the New York area, and within the Detroit metropolitan region, as well as among people with different tastes, commuting habits, and ages, make unsatisfactory any simplistic downward adjustment by 20 percent of compensations of each institution in the New York area in order to compare it to any of the institutions in the Detroit metropolitan area.

7. *"Neglect of differences in teaching loads renders the comparisons unsatisfactory."*

The argument here is that focusing on compensations neglects other vital aspects of academic life, including teaching loads, research facilities, and so on. We agree, but are unable to find any sensible basis for adjustment. The obvious deficiencies of reporting, for example, compensation per credit hour taught should indicate why we are cautious. The fact is, as we have noted before, that institutions differ from one another in many respects. One of these concerns the nature of expected duties, and this includes the definition of a full-time teaching load. If a college or university faculty chooses to accept higher teaching loads in order to obtain higher salaries (a trade that some have made), its levels of monetary compensation will rise, and it will rise in the reported rankings. We feel this is appropriate; its salaries *are* higher. Of course, its attractiveness in other dimensions will decline. We do not, and can not, incorporate all aspects of working conditions in our reports on compensations.

Planned Revisions in Future Scales

On the basis of criticisms received, as discussed above, we recognize the desirability of several modifications in our rating scheme. But we are likewise persuaded that the basic changes in the form of ratings adopted in 1969 have proven desirable. Effective next year, the following further changes will be instituted:

1. *The ten decile based ratings will be replaced by the following six ratings, for each category of institution, and for each rank:*

Rating	Percentiles	Interpretation
1*	95 or over	Top 5 percent of institutions
1	80-94	Next 15 percent
2	60-79	Next 20 percent
3	40-59	Next 20 percent
4	20-39	Next 20 percent
5	0-19	Lowest 20 percent

This will meet the need for a smaller "top" category, provide sufficient distinctions, and not be subject as much to statistical instability as the decile ratings.

2. *Ratings in every year will be based on the actual distributions for that year.* Thus, in 1972-73, precisely 40 percent, neither more nor less, will be rated 2 or above in each category. Projections will be used for guiding budgetary decisions but not for ratings. We will, for informational purposes, project the quintile distributions, two years ahead, using an index of per capita personal income.

Using *current* quintile distributions to determine current ratings will mean that no institution can predict with certainty its future rating, but this seems a relatively small price to pay for the unambiguous descriptive accuracy we achieve.

3. *Category II will be split into two categories.* Category IIA will include four-year institutions with significant graduate programs, but not so many as to qualify as institutions in Category I. They may be thought of as emerging universities. Category IIB will include institutions whose basic and primary function is a four-year baccalaureate program. As data are collected, institutions in the present Category II will be asked to indicate in which category (in their opinion) they should be included. (Scales based on a preliminary separation of these categories are published in this report.)

4. *A new Category IV will be created for institutions which do not have the usual academic ranks.* (Again, preliminary scales are published in this report.)

We believe that these two changes will go a long way toward avoiding heterogeneous groupings. Other possible subdivisions will be the subject of detailed analysis in the year to come.

5. *The data on increases in actual salaries by rank for individuals employed for two consecutive years will be supplemented by the use of two evaluative symbols.* The symbol - will be used for those institutions where the increase in salaries for that rank is less than the annual average increase in the cost-of-living index, and a + will mark those institutions whose increase in salaries has exceeded a measure that reflects a significant increase in relative status of the profession.

In introducing this change, we will surely be charged with introducing "Honors, Pass, Fail" grading to annual increases at the same time that we abandon grading of levels of compensations. The charge will be correct in one sense. Our defense is that there *are* meaningful economy-wide standards that ought to be noticed along with the relative performance of school against school. Thus, while the *ratings* compare each institution with other academic institutions, they say nothing about the profession as a whole. The three-way (-, nothing, +) identification of annual increases shows performance relative to external standards. We believe the cost of living represents a key national indicator, and keeping pace with it represents a minimum standard of performance. Failure to maintain this standard should not be allowed to go unnoted. We are aware that regional differences in the rate of change of the cost of living make this standard slightly ambiguous, but we lack the data to apply an institution-by-institution standard. The higher, +, rating will be selected by attention to earnings of other professional groups. The precise form of the index used to determine this standard has not yet been determined, but will be explained in detail next year. In every year we will present in our report a frequency distribution of institutions receiving each symbol.

Having made major changes in our ratings twice in two years has perhaps tried the patience of our members and our friends. We hope that the present scheme will prove both stable and helpful. We continue to anticipate receiving criticism and suggestions.

Part IV: Using the Data

The Appendices and Tables

The results of this year's survey are presented in two forms: detailed figures are listed by institution in Appendices I, II, and III, and summary results are presented in tables accompanying and following this text. Additional tables are available upon request. A list of these tables will be published in the final report in the Summer, 1971 *AAUP Bulletin*.

The format of the Appendices and the notations used therein are explained in notes just preceding them.

Table 9 gives the most general summary of the data collected. There were 271,585 full-time faculty members at participating institutions, earning an average compensation of \$14,707, of which 10 percent represented fringe benefits.

Table 10 shows the annual increases in average compensation for each of the past six years. These data reinforce the dismal picture described above: each rank shows an average increase barely above the increase in cost of living -- except for professors, whose average compensation increased only 5.8 percent.

Table 11 shows average salary and average compensation by rank, category, and type of control. It emphasizes a point made earlier: although church-related institutions achieved higher increases this year than did public or private independent schools, they started from a lower base and *remain* below the other groups.

Table 12 analyzes average salary by region, category, and rank. On most lines of the table, the highest average occurs in the Middle Atlantic states, but there are exceptions: Professors and Instructors in Category I (New England leads), Professors in Category IIB (the Pacific states lead), and Assistant Professors and Instructors in Category III (the Pacific states again).

Table 13 is similar to Table 12, except that it analyzes compensation rather than salary.

Tables 14 and 15 are the projected scales for 1971-72 and 1972-73 respectively. The former was computed from 1969-70 data by application of a 7.5 percent interest rate (compounded twice) to the 95th, 80th, 60th, 40th, and 20th percentiles. The latter was computed in the same fashion, using a 6 percent interest rate on 1970-71 data. Let us reiterate that these projected scales are to advise the profession as to the levels of compensation which *would* be reached if (a) the economy grew at the indicated rate over the two-year period involved, and (b) the profession maintained its relative position among U. S. income earners. They are intended as *descriptive* rather than *normative* scales. Institutions will be rated each year on the basis of actual data reported, not arbitrary preset scales.

Table 16 provides the figures used to construct Figure III, plus more detail. In brief, it shows that in most ranks and categories, more than half of the institutions increased average salaries by *less* than the Consumer Price Index.

Table 17 shows the percentages of institutions which increased average salaries for *faculty on staff both years* by less than the CPI. Although the figures are better than those in Table 16, they are by no means encouraging.

Table 18 shows the relative indices for full-time faculty, full-time students, and faculty-student ratio which were used in constructing Figure IV.

Table 19 details the relative indices used to draw Figure V, which showed the relationship between the CPI, the per capita personal income, and the average salaries for an historical sample.

Table 20 shows the distribution of the 1345 participating institutions (excluding medical schools) by category and type of control.

Finally, Table 21 shows those institutions with the highest faculty compensation per full-time student equivalent. This measure is subject to considerable variation as a result of different institutional functions and structures. Consequently, we recommend that it be used with caution.

Further Analyses Available

This year we are formalizing a service which has been available informally for many years. Upon request (within the limits of available staff time) we will prepare analyses of salary or compensation for any reasonable comparison group. For this purpose we have available both averages by rank and frequency distributions of salaries within ranks. The latter set of data can be used only in sufficiently large comparison groups to insure confidentiality of individual institutional data. Inquiries regarding this service should be directed to Mrs. Maryse Eymonerie, Survey Director, American Association of University Professors, One Dupont Circle -- Suite 500, Washington, D. C. 20036. A charge will be made to cover computer costs, handling, and mailing.

Readers should note that Appendix I contains sufficient information from which to prepare many useful analyses. Average compensation comparisons, analyses of fringe benefits, and average salary increase comparisons can all be made directly from that table.

* * * * *

In summary, let us reiterate our three major conclusions:

- (1) The financial crisis in higher education is steadily growing more acute, and faculty are paying a heavy share of the cost;
- (2) We appreciate the interest expressed by our many correspondents, and hope that the modifications detailed here will significantly increase the usefulness of the survey to the entire profession; and
- (3) We stand ready to assist in further analysis and use of our data.

Our efforts depend upon the cooperation of many people. To all of them we express the gratitude of the academic community.

Peter O. Steiner
Maryse Eymonerie
William B. Woolf

INDEX OF TABLES

¹ Data for last year (1968-69 to 1969-70), two years ago (1967-68 to 1968-69), three years ago (1966-67 to 1967-68), four years ago (1965-66 to 1966-67), and five years (1964-65 to 1965-66) are taken from AAUP Bulletin, Summer, 1970, Table 7, p. 196.

² In calculating these figures, we used what amounts to a Paasche Index, since numbers of persons who are currently in the various ranks were employed as weight. Thus we computed as base what average compensation would have been last year if relative numbers in the different ranks had been what they are currently.

CATEGORY IIB					
Professor	22,530	19,660	17,550	16,590	14,860
Associate Professor	17,250	15,620	14,490	13,510	12,750
Assistant Professor	14,310	12,940	12,170	11,630	11,000
Instructor	11,870	10,690	10,240	9,820	9,370
CATEGORY III					
Professor	27,850	21,550	19,190	17,030	15,280
Associate Professor	22,470	17,510	16,290	14,470	13,360
Assistant Professor	18,250	15,100	13,540	12,640	11,610
Instructor	16,090	13,100	11,650	10,540	9,800
CATEGORY IV					
Only One Rank	16,810	15,690	14,610	13,230	11,460

NOTE: Category I - includes institutions which offer the doctorate degree, and which conferred in the most recent three years an annual average of fifteen or more earned doctorates covering a minimum of three nonrelated disciplines.

Category IIA - includes institutions awarding degrees above the baccalaureate but not included in Category I.

Category IIB - includes institutions awarding only the baccalaureate or equivalent degree.

Category III - includes two-year institutions.

Category IV - includes institutions without academic ranks.

Interpretation of the Ratings:

- * = 95th percentile
- 1 = 80th percentile
- 2 = 60th percentile
- 3 = 40th percentile
- 4 = 20th percentile

Average compensations lower than the 20th percentile will be rated "5".

¹ The compensation figures for ratings 1, 2, 3, and 4 have been obtained by increasing the actual 1969-70 percentiles (80th, 60th, 40th and 20th respectively) by 7.5 percent compounded twice and therefore are different from the 2, 4, 6, and 8 ratings previously published. The former ratings had been obtained by a smoothing method (e.g., ninth decile plus seventh decile divided by two) which is longer utilized.

CATEGORY IV					
Only One Rank	17,470	16,430	14,880	13,010	11,150

NOTE: Category I - includes institutions which offer the doctorate degree, and which conferred in the most recent three years an annual average of fifteen or more earned doctorates covering a minimum of three nonrelated disciplines.
 Category IIA - includes institutions awarding degrees above the baccalaureate but not included in Category I.
 Category IIB - includes institutions awarding only the baccalaureate or equivalent degree.
 Category III - includes two-year institutions.
 Category IV - includes institutions without academic ranks.

Interpretation of the Ratings:

* = 95th percentile
 1 = 80th percentile
 2 = 60th percentile
 3 = 40th percentile
 4 = 20th percentile

Average compensations lower than the
 20th percentile will be rated "5".

¹ The ratings 1*, 1, 2, 3, and 4 represent the 95th, 80th, 60th, 40th, and 20th percentiles respectively of the 1970-71 actual decile distribution of average compensations increased by 6.0 percent compounded twice.

Table 16

Massachusetts Institute of Technology	Haverford College
Yeshiva University - Graduate Division	Wilson College
Princeton University	University of Rochester
University of Chicago	Johns Hopkins University
Harvey Mudd College	Swarthmore College
Amherst College	Brandeis University
Sarah Lawrence College	Rice University

APPENDIX I

INSTITUTIONS WITH PROFESSORIAL RANKS
SUBMITTING DATA FOR 1970-71

Rating of Average Compensations are based upon the 1970-71 projected scales. For explanations see column (3).

Compensation includes salary (adjusted to a nine-month basis, when necessary) plus countable fringe benefits. Where faculty members are given duties for eleven or twelve months, salaries are converted to a nine-month basis by applying a conversion factor of 9/11 or by the official conversion factor used in a publicly announced formula.

Fringe benefits, in general, include only those where the institution makes a definitive payment of a specified amount on behalf of and for the benefit of the individual faculty member. The major benefits are contributions by the institution (1) to Federal Old Age, Survivors, and Disability Insurance (because of the pending status of the Social Security Amendment Act, FICA payments have been calculated at 5.2 percent of the first \$9,000 of salary); (2) to retirement programs to the extent that these benefits become vested in the faculty member in five years or less; (3) for life insurance, hospital, and medical insurance and disability income protection; (4) for workmen's compensation; (5) unemployment compensation taxes; (6) for housing allowances or for housing only if an equivalent cash benefit is available to all faculty members who prefer to live in houses other than those provided by the institution; (7) for tuition of faculty children only if the institution arranges for cash assistance for all children of faculty members, regardless of the institution they attend (the institution's total contribution is considered to be the maximum annual cash allowance made available per student multiplied by the number of faculty children attending college). Because of the difficulties involved in determining their value, benefits in kind are not included. Since the objective of the survey is the measurement of income available for personal consumption, as distinct from professional purposes, benefits of a professional nature (such as convention travel, membership fees, grading assistance, faculty clubs, etc.) are not included.

Explanation of Statistical Data

Col. (1) PNA (Publication not authorized) or a footnote. In this preliminary report, the footnotes are not listed but they will be inserted for the final report.

Col. (2) V - Indicates that the institution has a retirement plan in which its contribution is vested in the faculty member in five years or less.

Col. (3) Institution's category - Category I includes institutions which offer the doctorate degree, and which conferred in the most recent three years an annual average of fifteen or more earned doctorates covering a minimum of three nonrelated disciplines. Category II includes institutions granting the baccalaureate degree or higher, but not included in Category I. Category III includes two-year institutions.

Col. (4) Ratings of Average Compensation by Rank indicates the rating of average compensation, as based upon the AAUP Average Compensation Projected Scales for 1970-71 in order of Professor, Associate Professor, Assistant Professor, and Instructor.

Col. (5) Number of full-time faculty members by rank, 1970-71.

APPENDIX I - CONTINUED

Col. (6) Average Compensation, by Rank, includes salary plus countable fringe benefits (salaries have been adjusted to nine-month basis, where necessary). The figure has been rounded to the nearest hundred dollars; an entry of 17,6 would stand for an average compensation between \$17,550 and \$17,649.

Col. (7) Fringe Benefits as Percent of Average Salary

Col. (8) Actual Percentage Increase in Salary. This represents the increase in salary for faculty on staff both years.

Col. (9) Announced Minimum Salary (rounded to the nearest hundred dollars). The asterisk indicates that some individuals received less than the announced minimum salary in that rank.

Col. (10) Salary Distributions (all ranks combined). These figures represent the salary quartiles of the distribution of faculty salaries for the institution as a whole.

Col. (11) Full-time Faculty Compensation per Student-Equivalent is determined by number of full-time student-equivalents. Because of the diversity of situations no attempt has been made to standardize the concept of "full-time student-equivalent"; each institution has applied its own definition. In the case of some public institutions the standards used for the AAUP report may not be those used for budgetary purposes and hence statistics may differ from those appearing in official state reports. In view of the diversity of standards for full-time student-equivalents and the great variety in the types and functions of the institutions included in the tabulations, extreme caution should be used in making comparisons.

Statistical Note: It must be pointed out that average compensations are likely to be affected by a number of peripheral influences. For example, an institution may use a high proportion of part-time graduate assistants whose compensations are not included in the average figures for full-time faculty. Figures for these institutions, therefore, overstate the typical remuneration of those who carry the teaching burden. Average figures for small colleges may also be influenced by the fact that in any given year a relatively large number of their higher paid faculty members may be on leave without pay.

In addition, actual improvements in the economic well-being of the faculty may be concealed in any given year by promotions, for they may exercise a double-edged effect upon the average compensations reported in both the higher and the lower rank. Unfortunately, we have found no feasible way to make appropriate adjustments for these occurrences and can only caution the reader to keep these peripheral influences in mind as he uses the report.
